

Use Case: Book Dose Appointment

Main Success Scenario:

1. Customer selects “Book Appointment” option from their dashboard.
2. System displays dose slots filtered to the citizen’s eligible cohort, location and vaccine type.
3. Citizen selects preferred date, time, and site from the available slots.
4. System re-checks eligibility (cohort status, minimum inter-dose interval) and confirm the slot is still open.
5. Citizen confirms the selection.
6. System reserves the slot, decrements site capacity, and creates an appointment record.
7. System sends a booking confirmation to the citizen (in-app, SMS, and/or email) with a QR check-in code.
8. System schedules automated reminders for 48 hours and 2 hours before the appointment.

Alternate Flows:

4a. Selected slot no longer available

- 4a1. System detects the slot was booked by another citizen between selection and confirmation.
- 4a2. System notifies the citizen that the slot is no longer available.
- 4a3. System returns the citizen to the slot list, refreshed with current availability.
- 4a4. Citizen selects a different slot and resumes at Step 3 of the main flow.

4b. Re-check fails

- 4b1. System determines the citizen no longer meets cohort eligibility or the minimum inter-dose interval has not elapsed.
- 4b2. System blocks the booking and displays the specific reasons(e.g. “Dose 2 available on or after 15-Sep-2026”).
- 4b3. System offers the citizen the earliest date they become eligible, if applicable.
